

All operating controls are perfectly placed

The control pillar offers a highly accessible and visually appealing solution if the necessary controls can't be installed next to the door. All of the sliding door's operating controls can be centrally placed and in plain view

The installation of the control pillar is between the header of the sliding door and the floor, with a mounting-adapter in each case. Independent of local conditions, it is designed to perform highly flexible functions. Not only for new door systems but also for subsequent extensions or upgrading, the control pillar offers new possibilities for the mounting of the control elements.
